PACKAGING TECHNOLOGY & MACHINERY

RANGE of wrap-around cartoning machines

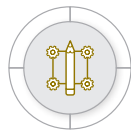

► The range

Atlanta wrap-around cartoning machines wrap the box around the product, starting with a flat sheet of pre-punched cardboard: this technological solution ensures **maximum product stability** inside the pack and produces an extremely solid pack. The precision with which they wrap the box around the product, creating tidy, stackable and eco-friendly packs

is the reason these machines prove so popular in the beverage, food, chemicals and personal care industries. Versatile and hard-wearing, they require minimal maintenance, retaining constant superior quality performance over the years and allowing a rapid return on investment thanks to an especially beneficial total cost of ownership.

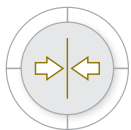

Suitable for the most varied formats: particularly suitable for irregularly shaped containers and bottles, with special caps or with dispenser.

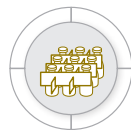

Designed for your product: the entire product path and its movement are optimised according to the samples you supply.

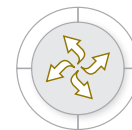

Multi-layer: precision Pick&Place unit to overlay product on several layers (Raffaello Series).

It manages blanks of different thickness, even very thin (1.5 mm) or which are not perfectly flat.

Honeycomb protection: the honeycomb protection inserter allows the insertion of a separating sheet between the individual products to avoid problems while the package is transported.

Versatile and hard-wearing, it requires minimal maintenance and retains constant superior quality performance over the years.

► Combi Series [Combined wrap-around system plus film]

"All in one" solution for all those who need to pack their product using both film and cardboard boxes. Combi is the packaging machine that wraps your products using tray only, tray with film and wrap around box packs.

TRAY, TRAY + FILM, WRAP-AROUND
